

Battery cabinet detection

Overview

Why is early detection important for lithium-ion battery energy storage systems?

Early detection allows mitigation steps to be carried out long before a potentially disastrous event, such as lithium-ion battery fire. With 5 times faster detection capability, Siemens fire detection products contribute to stationary lithium-ion battery energy storage systems manageable risk.

Can a lithium-ion battery energy storage system detect a fire?

Since December 2019, Siemens has been offering a VdS-certified fire detection concept for stationary lithium-ion battery energy storage systems.* Through Siemens research with multiple lithium-ion battery manufacturers, the FDA unit has proven to detect a pending battery fire event up to 5 times faster than competitive detection technologies.

Do you need a gas detection system for your battery storage space?

Each battery type presents its own unique gas threats so it's important to provide the appropriate kind of gas detection for your application. While all battery storage spaces need to be fitted with ventilation, these systems won't provide you with sufficient protection from gas leaks. +44 (0)161 483 1415.

What is a lithium-ion battery off-gas detector?

The term "OGP" refers to detection of small off-gas particles produced in the earliest stages of lithium-ion battery overheating and those commonly found in flaming fires. The FDA241 unit offers proven reliability in early detection of lithium-ion battery Off-Gas particles during the "pre-thermal runaway" period of battery failure.

Long Product Lifecycle Features and Benefits Applications As its name implies - "aspirated" smoke and off-gas detection systems use an "aspirator" mounted in a detector unit. The detector connects to a sample pipe network mounted within the area or object being protected. Using the suction from the aspirator, air is continuously sampled and transported to the detection chamber for analysis for particles See more on assets.new.siemens hj-net
