

Can micro inverters generate electricity

Overview

Can a microinverter generate more electricity than a string inverter?

A solar panel set-up using microinverters has the potential to generate more electricity than one using a traditional string inverter. The reason for this is that each panel using a microinverter essentially has its own circuit compared to a string inverter setup where a group or all panels share the same circuit.

How do microinverters work?

Microinverters convert the electricity from your solar panels into usable electricity. Unlike centralized string inverters, which are typically responsible for an entire solar panel system, microinverters are installed at the individual solar panel site.

Why do solar panels have micro inverters?

This means that each panel has its own inverter, allowing individual panels to perform at their best, irrespective of how other panels are performing. Micro inverters offer better solar energy yields in partly shaded environments and provide detailed monitoring for each panel.

Why should you install a micro inverter?

Ideal for shaded areas: If your rooftop is shaded, reducing the power generation of the solar panels, installing a micro inverter can help generate more power. Better monitoring: In micro inverters all the solar panels are monitored separately. If there is a problem in any one panel, we can easily identify and replace it.
