

Direct solar energy system

Overview

What is a direct solar system?

A direct solar system is much easier to build than an autonomous system with batteries, but it often requires modifications on the appliance side. Some devices can be connected directly to a solar panel: it is enough to connect the positive and negative contacts of the solar panel and the device.

Why is direct use of solar power important?

Moreover, direct use of solar power avoids the charging and discharging losses caused by batteries, or the energy losses in the transmission infrastructure for grid-connected systems. Both have to be offset by additional solar panels.

Is direct solar energy a viable energy source?

Although it is true that direct solar energy provides only a very small fraction of global energy supply today, it has the largest technical potential of all energy sources. In concert with technical improvements and resulting cost reductions, it could see dramatically expanded use in the decades to come.

How are direct solar energy technologies part of the broader energy framework?

This section discusses how direct solar energy technologies are part of the broader energy framework, focusing specifically on the following: low-capacity energy demand; district heating and other thermal loads; PV generation characteristics and the smoothing effect; and CSP generation characteristics and grid stabilization.
