

NTC in home inverter

Overview

What is an NTC thermistor in a DC-DC converter?

Application: Inrush current limiting in a DC-DC converter In the DC power circuit of a DC-DC converter or the like, an NTC thermistor is used as a power thermistor and effectively limits an inrush current, with which the input and output capacitors are charged at the time of powering on.

What are NTC thermistors?

NTC thermistors are temperature-dependent resistors that employ special semiconductor ceramics with a negative temperature coefficient (NTC). They have a high resistance at room temperature, and when they are energized, they generate heat by themselves and the resistance falls as their temperature rises.

What are examples of NTC thermistors for inrush current limiting?

Sample applications of NTC thermistors for inrush current limiting Various switch-mode power supplies (SMPS) - which are small, lightweight, and high-performance - are often used as power supplies of electronic devices. At the time of powering on an SMPS, the device is charged with an inrush current with a high peak to charge a smoothing capacitor.

What is temperature sensing with NTC circuit?

Temperature sensing with NTC circuit (Rev. A) This temperature sensing circuit uses a resistor in series with a negative-temperature-coefficient (NTC) thermistor to form a voltage divider, which has the effect of producing an output voltage that is linear over temperature.

NTC in home inverter

[Ntc Temperature Sensor Using in Heat Sink Temperature ...](#)

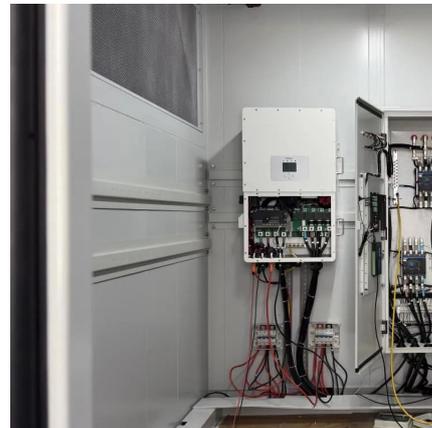

Product Description NTC temperature sensor using in heat sink temperature measurement of UPS, Inverters consist of NTC thermistor, wire, connector and temperature ...
