

Solar panel windbreak

Overview

Does windbreak reduce wind loads on solar panels?

The current study aims at investigating windbreak's effect on reducing wind loads on solar panels. Therefore, force coefficients, deformation, and maximum von Mises stress were obtained with and without windbreak at the baseline case parameters defined in Table 2.

Do windbreaks protect panels from wind load?

For the range of the studied velocities (10–35 m/s), windbreaks were very efficient in protecting the panels from wind loading. Wind loads were reduced by almost 100% in the vicinity of the windbreak and partially protected the panels up to $d/H = 70$ distance. This ensures the safety of the structure and asset protection in extreme wind conditions.

Can windbreaks be used for solar PV protection?

Literature has many examples of using windbreaks, with very few related to solar PV protection. investigated the reduction of wind loads on heliostat using both high porosity mesh grid and edge-mounted porous mesh. They found that the mesh grid reduced peak loads by 50%, while the porous mesh reduced it by 30%.

How to choose a windbreak for a PV system?

So, using windbreaks is a highly recommended option in all PV installations as a passive cost-free protective component. The best design parameters for the windbreak based on performance, cost, and area utilization are $H/E = 1$, porosity = 20% and panel is placed at distance from the windbreak ranges from 3 to 10H.
