

# Solar water pump system installation requirements

## Overview

---

How do you design a solar water pumping system?

When designing a solar pumping system, the designer must match the individual components together. A solar water pumping system consists of three major components: the solar array, pump controller and electric water pump (motor and pump) as shown in Figure 1.

How to install a solar water pump?

Installing a Solar water pumps solar water pump involves a series of steps. It starts with determining the ideal location for the pump, ensuring open sunlight exposure. Mounting the pump securely and connecting it to the water source and solar panels are pivotal steps. Adequate testing post-installation guarantees optimal functionality.

What are the components of a solar water pumping system?

A solar water pumping system consists of three major components: the solar array, pump controller and electric water pump (motor and pump) as shown in Figure 1. Note: Motor and pump are typically directly connected by one shaft and viewed as one unit, however occasionally belts or gears may be used to interconnect the two shafts.

How to choose a solar water pumping system?

The type of solar water pumping system: borehole/well (submerged), floating or surface will depend on the water source. If the source is a borehole (proposed or existing) or deep well, then a submersible pump that fits the borehole or well should be selected. If the water source is a river, then a surface pump should usually be selected.
