

The cells inside the solar panel

Overview

How do solar panels work?

In the sections ahead, we'll walk through each part so you can better understand how solar panels work and why they're built to last for decades. Also known as photovoltaic (PV) cells, solar cells are the heart of a solar panel. They're made from semiconductor materials, typically silicon, that convert sunlight directly into electricity.

What are the parts of a solar panel?

Most panels include solar cells, tempered glass, encapsulant, a backsheet, a metal frame, an inverter, and a junction box. In the sections ahead, we'll walk through each part so you can better understand how solar panels work and why they're built to last for decades.

What materials are used in solar cells?

Materials Used in Solar Cells Silicon: The most common material used in solar cells, known for its effectiveness in converting sunlight to electricity. Silicon can be found in different forms, such as monocrystalline, polycrystalline, and amorphous (thin-film).

How do solar panels generate electricity?

Solar panels generate electricity from UV lighting even in cloudy conditions – they are made out of solar cells, that convert the sun's energy into electricity. Solar cells are sandwiched between layers of semi-conducting materials like silicon.

The cells inside the solar panel

[The Anatomy of A Solar Panel , edp](#)

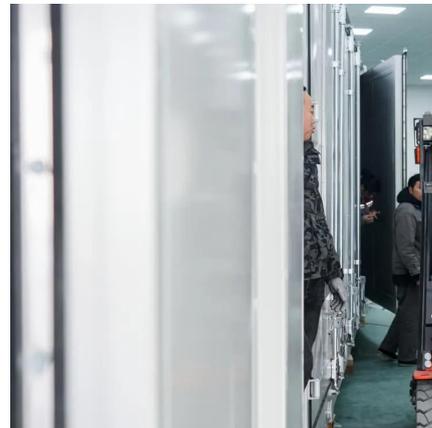

Typical solar panels today consist of either 60 or 72 of these cells assembled together. From there, the electricity travels away from the panel, toward other parts of a solar ...
